DANIELLE RAGER, PhD

danielle@cortical.network

cortical.network ◇ github.com/dmrager

SKILLS

- Recurrent neural network simulation
- Mathematical modeling
- Data analysis
- Parallel and distributed computing solutions
- Systems neuroscience expertise
- Statistical and Machine Learning models
- Scientific computing in Julia, Python, Matlab, R, C++, C
- Scientific writing and research communication

EDUCATION

Carnegie Mellon University *August 2013 - April 2020*
Doctor of Philosophy, Neural Computation
Dissertation: *The structure and dimension of variability across multi-area cortical circuits*
My thesis research used non-parametric regression models, dimensionality reduction techniques, and spiking network models to examine the propagation of shared variability across cortical regions as a means to understand the dynamics of multi-area brain computation.

University of Pittsburgh *August 2008 - April 2012*
Bachelor of Science, Bioengineering, *magna cum laude*
Minors, Neuroscience and Music

FELLOWSHIPS AND SCHOLARSHIPS

US Dept. of Energy Computational Science Graduate Fellowship *August 2014 - August 2018*
4.5% acceptance rate

Whitaker International Fellowship for Biomedical Research *July 2012 - August 2013*

Fulbright Scholarship Finalist *2012*

Undergraduate Program in Neural Computation Fellowship *May 2010 - August 2011*
Carnegie Mellon University and University of Pittsburgh

Swanson School of Engineering Scholarship *August 2008 - April 2012*
University of Pittsburgh

University Honors College Full Tuition Scholarship *August 2008 - April 2012*
University of Pittsburgh

RESEARCH

Tuned assemblies expand the dimension of shared variability in cortical networks *2016-2020*
Advisor: Brent Doiron, University of Pittsburgh Department of Mathematics
Data: Smith Lab, Carnegie Mellon University Department of Biomedical Engineering
Presented new evidence that the dimension of shared variability increases from V4 to PFC during distributed processing of visual stimuli. Developed a mechanistic, multi-layer spiking network model of V4 and PFC with tuned assemblies that, through non-linear recurrent dynamics, replicated the dimensionality expansion observed *in vivo*.

Scalable Factor Analysis *2016*
Led a team of Computer Science and Data Science graduate students in developing a scalable, distributed implementation of Factor Analysis using cluster-computing framework Apache Spark.

Proprioceptive feedback modulates motor tuning during human BMI control *2013-2016*
Advisor: Valerie Ventura, Carnegie Mellon University Department of Statistics

Data: University of Pittsburgh Rehab Neural Engineering Lab
Discovered that motor tuning was overwhelmed by low-rank, shared variability in M1 activity when a human subject with a motor neuropathy and intact sensation received proprioceptive feedback during use of an intracortical brain machine interface. Developed a new, generalized linear model of M1 encoding that accounted for this latent, low-rank shared variability.

Tactile afferent stimulation patterns for sensory feedback in neural prostheses *2012-2013*
Advisor: Richard Vickery, University of New South Wales School of Medical Sciences
Demonstrated that a new, multi-axial tactile sensor composed of gold nanoparticle strain gauges was able to reconstruct the three dimensional forces incident on the sensors surface when it recorded a slipping object. Used a spiking model to encode the sensor's recorded slip forces as a pattern of electrical activity intended for biomimetic stimulation of tactile afferents in patients with neuroprosthetics.

Spline regression models for real-time decoding of primary afferent activity *2010-2012*
University of Pittsburgh Rehab Neural Engineering Lab
Developed a flexible, non-parametric spline regression model to predict limb kinematics from primary afferent activity for closed loop neuroprostheses using functional electrical stimulation.

WORK EXPERIENCE

Postdoctoral researcher, Carnegie Mellon University Neuroscience Institute *2020*

Lawrence Berkeley National Laboratory, Department of Energy Office of Science *2015*
Biological Systems and Engineering Division
Developed hierarchical regression models of auditory tuning and recurrent connectivity in auditory cortex using the Union of Intersections Lasso technique, a novel statistical framework for model selection.

Johns Hopkins University Applied Physics Laboratory
National Security Analysis Division *2010 - 2012*
Contributed to the Stage 3 of the Defense Advanced Research Projects Agency Revolutionizing Prosthetics Initiative by studying cortical stimulation thresholds and complex percept feedback. Designed a training environment for a situational awareness experiment using transcranial direct current stimulation (tDCS). Collected and analyzed EEG and physiological data for a neuropsychological experiment.
Cyber Operations Division *2009 - 2011*
Developed a semantic web ontology designed to support the next generation of the Information Sharing and Collaboration Environment for governmental computer emergencies and cybersecurity attacks.

TEACHING EXPERIENCE

MATH 1370: Introduction to Computational Neuroscience, University of Pittsburgh *2015*
Teaching assistant to Prof. Brent Doiron. Responsible for teaching recitations and holding office hours.

SELECTED TALKS

Computational and Systems Neuroscience (Cosyne) 4.5% talk acceptance rate. *2020*
The Tactile Research Group Meeting *2011*
